

ONBOARD360 — AS-IS Pain Point & Bottleneck Analysis

1. Queue Buffer Congestion (Little's Law)

Applying Little's Law ($L = \lambda * W$) to the 520,000 annual application volume reveals an ongoing work-in-progress (WIP) of 3,485 active applications, with 3,111 applications queued idly in operations backlogs at any given moment.

2. Upstream Document Quality Failures

Legacy mobile and web portals accept raw photos without evaluating focus, blur, or glare. Illegible uploads pass directly into manual L1 review queues, consuming 1.8 hours of analyst touch time per case and creating massive downstream bottlenecks.

3. Root Cause Isolation (Pareto Principle)

Pareto analysis demonstrates that 83.2% of all rework volume is driven by three preventable flaws: Blurry Images (42.1%), Expired IDs (23.0%), and Address Mismatches (18.0%). Upstream client-side validation eliminates over 70% of rework volume.
